## Murray Sheep Handler

The Murray Sheep Handler is a double race that allow sheep to race along side by side to effortlessly fill the machine with the animals head over the back of the sheep in front so they can't pull away from the operator. The machine cannot break legs as the sheep are lifted comfortably by the sides so valuable rams can't be hurt and the double race prevents the animals from turning around so they are in the right direction for unloading.

The Murray Sheep Handler is 7.1m long and one operator can easily drench, back-line, wool-class, inoculate & ear tag around 300 sheep per hour (600 with two men). Grinding & checking teeth is made easy, even Toe clipping can be done by slowing the sheep down and loading half a dozen at a time and rolling the animal onto it's back inside the race nb/-a pillow behind their head will stop the animal kicking.

With nearly twice the length of other machines, the Murray Sheep Handler is faster to load and operate, is air operated with very low pressure required, and is totally mobile with removable hitch and wheels.

Price: \$28,000 + gst
